Experiment 1,2 - advertising.csv
Experiment 3,4,5 - smarket.csv (exp3 is summery)
Experiment 6,7,8,9,10 - collegedata.csv (exp7 is summery)

Github link: https://github.com/jaswanthgec/data-science-lab
All the datasets are available in the github link

Experiment 1: Apply least squares model for the regression

```
import pandas as pd
import numpy as np
from sklearn.linear_model import LinearRegression
data = pd.read_csv('advertising.csv')

x = data['TV'].values.reshape(-1, 1)
y = data['Sales'].values
model = LinearRegression().fit(x, y)
tv_coef = model.coef_[0]
print("Least squares coefficient for TV:", tv_coef)
```

Least squares coefficient for TV: 0.05546477046955886

Experiment 2: Compute t-statistic, Residual standard error, F-statistic and residual sum of squares (RSS) errors.

```
import statsmodels.api as sm
x = data['TV'].values
y =data['Sales'].values
x = sm.add_constant(x)
model = sm.OLS(y, x).fit()
t_stat = model.tvalues[1]  #T - Statistics
rse = model.mse_resid ** 0.5  #Residual Standard Error
f_stat = model.fvalue  #F - Statistic
rss = model.ssr  #Residual Sum of Squares Error
print("T-Statistic:", t_stat)
print("Residual Standard Error:", rse)
print("F-Statistic:", f_stat)
print("Residual Sum of Squares (RSS):", rss)
```

```
T-Statistic: 29.260497480686528
Residual Standard Error: 2.2957457136214456
F-Statistic: 856.1767128172628
Residual Sum of Squares (RSS): 1043.5487795590257
```

Experiment 3:
Write about the statistically significant - hypothesis

Experiment 4: Compute the confusion matrix and accuracy

```
from sklearn.neighbors import KNeighborsClassifier as K
from sklearn.metrics import*
df = pd.read_csv('smarket.csv')
x = df[['Lag1', 'Lag2', 'Lag3', 'Lag4', 'Lag5', 'Volume']]
y = df['Direction']
m=K(n_neighbors=3).fit(x,y)
print("Confusion
Matrix:\n",confusion_matrix(y,m.predict(x)))
print("Accuracy Score:",accuracy_score(y,m.predict(x)))
```

```
Confusion Matrix:
 [[445 157]
 [147 501]]
Accuracy Score: 0.7568
```

Experiment 5:Compute R-squared, Mallow’s Cp, AIC and BIC:

```
from sklearn.neighbors import KNeighborsClassifier as k
from sklearn.model_selection import train_test_split as tts
from sklearn.preprocessing import StandardScaler
from sklearn.metrics import r2_score

data = pd.read_csv('smarket.csv')
data['Direction']=data['Direction'].map({'Up':1,'Down':0})
X=data[['Lag1', 'Lag2', 'Lag3', 'Lag4', 'Lag5', 'Volume']]
y = data['Direction']
X_train, X_test, y_train, y_test = tts(X, y, test_size=0.2)

knn = k(n_neighbors=3)
knn.fit(X_train, y_train)
y_pred = knn.predict(X_test)
# Compute R-squared, Mallow’s Cp, AIC and BIC:
r_squared = r2_score(y_test, y_pred)
mse = np.mean((y_test - y_pred) ** 2)
cp = mse + 2 * X_test.shape[1] * (mse / len(y_test))
aic = len(y_test) * np.log(mse) + X_test.shape[1] * 2
bic = len(y_test) * np.log(mse) + X_test.shape[1] * mse

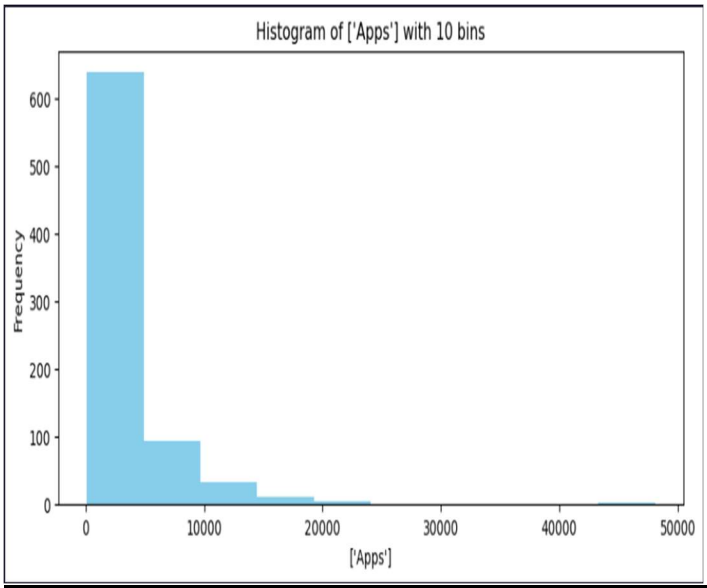
print("R-squared:", r_squared)
print("Mallow's Cp:", cp)
print("AIC:", aic)
print("BIC:", bic)
```

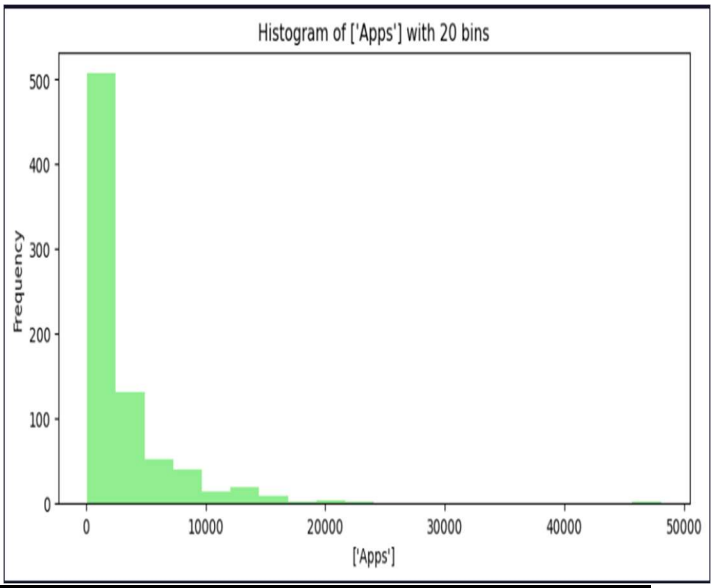
```
R-squared: -1.0500993016849263
Mallow's Cp: 0.536576
AIC: -155.3576634856573
BIC: -164.2856634856573
```

#Experiment 6: histograms with differing no. of bins for few of the variables

```
import pandas as pd
import matplotlib.pyplot as plt
college_data = pd.read_csv('collegedata.csv')
var = ['Apps'] # you can add some more variables and using
a for loop

plt.figure(figsize=(10, 4))
plt.hist(college_data[var], bins=10, color='skyblue')
plt.title(f'Histogram of {var} with 10 bins')
plt.xlabel(var)
plt.ylabel('Frequency')
plt.show()
plt.figure(figsize=(10, 4))
plt.hist(college_data[var], bins=20, color='lightgreen')
plt.title(f'Histogram of {var} with 20 bins')
plt.xlabel(var)
plt.ylabel('Frequency')
plt.show()
```





Experiment 7:Write about the histograms that you observed

```
# Experiment 8: Calc Pearson, Spearman, Kendall correlation
```

```
from scipy.stats import pearsonr, spearmanr, kendalltau
var = ['Apps', 'Accept', 'Enroll']

# Calculate Pearson, Spearman , Kendall correlation

pearson_corr = college_data[var].corr(method='pearson')
spearman_corr = college_data[var].corr(method='spearman')
kendall_corr = college_data[var].corr(method='kendall')

print("Pearson Correlation:\n",pearson_corr)
print("\nSpearman Correlation:\n",spearman_corr)
print("\nKendall Correlation:\n",kendall_corr)
```

```
Pearson Correlation:
              Apps    Accept    Enroll
Apps    1.000000  0.943451  0.846822
Accept  0.943451  1.000000  0.911637
Enroll  0.846822  0.911637  1.000000

Spearman Correlation:
              Apps   Accept    Enroll
Apps    1.000000  0.97939  0.926169
Accept  0.979390  1.00000  0.946400
Enroll  0.926169  0.94640  1.000000

Kendall Correlation:
              Apps    Accept    Enroll
Apps    1.000000  0.886006  0.763762
Accept  0.886006  1.000000  0.801569
Enroll  0.763762  0.801569  1.000000
```

Experiment 9: Perform Simple Hypothesis testing, student's t-test, paired t and u test, correlation and covariance, tests for association.

```
import pandas as pd
from scipy.stats import ttest_1samp, ttest_rel, ttest_ind, mannwhitneyu,
pearsonr, spearmanr, kendalltau, chi2_contingency
college_data = pd.read_csv('collegedata.csv')

t_statistic, p_value = ttest_1samp(college_data['Apps'], 1000)
print("Simple Hypothesis T-test statistic: ",t_statistic)

group1 = college_data[college_data['Private'] == 'Yes']['Accept']
group2 = college_data[college_data['Private'] == 'No']['Accept']
t_statistic, p_value = ttest_ind(group1, group2)
print("\nStudent T-test statistic:",t_statistic)

t_statistic, p_value = ttest_rel(college_data['Apps'], college_data['Accept'])
print("\nPaired t-test between Apps and Accept: ",t_statistic)

group1 = college_data[college_data['Private'] == 'Yes']['Accept']
group2 = college_data[college_data['Private'] == 'No']['Accept']
u_statistic, p_value = mannwhitneyu(group1, group2)
print("\nU test statistic:",u_statistic)

correlation = college_data[['Apps', 'Accept', 'Enroll']].corr(method='pearson')
print("\nCorrelation:\n",correlation)

covariance = college_data['Apps'].cov(college_data['Accept'])
print("\nCovariance",covariance)

contingency_table = pd.crosstab(college_data['Apps'], college_data['Accept'])
chi2_statistic, p_value, _, _ = chi2_contingency(contingency_table)
print("\nChi-square Test statistic:",chi2_statistic)
```

```
Simple Hypothesis T-test statistic:  14.416590015808657

Student T-test statistic: -15.037175252579376

Paired t-test between Apps and Accept:  15.593495811336158

U test statistic: 21811.0

Correlation:
            Apps    Accept    Enroll
Apps    1.000000  0.943451  0.846822
Accept  0.943451  1.000000  0.911637
Enroll  0.846822  0.911637  1.000000

Covariance 8949859.811893819

Chi-square Test statistic: 494905.8333333331
```

Experiment 10: Eigen values and Eigen vectors.

```python
import numpy as np
array = np.array([[1, 2], [2, 1]])
# Compute eigenvalues and eigenvectors
eigenvalues, eigenvectors = np.linalg.eig(array)
# Print eigenvalues and eigenvectors
print("Eigenvalues:",eigenvalues)
print("Eigenvectors:\n",eigenvectors)
```

```
Eigenvalues: [ 3. -1.]
Eigenvectors:
 [[ 0.70710678 -0.70710678]
 [ 0.70710678  0.70710678]]
```
